TITLE: Transplantation of articular bone ends and prerequisites for replacement of whole joints

CITED SOURCE: Sb. 3 Vses. konferentsiya po peresadke tkaney i organov, 1963. Yerevan, 1963, 286-287

TOPIC TAGS: dog, human, transplantation, bone, joint, knee, homotransplantation

TRANSLATION: Homotransplantation of articular bone ends of extremities preserved at low temperatures (-70°) was performed in an experiment on dogs and on 40 patients. Joints were taken from cadavers in a clinic. Restoration of joint function was ensured by good condition of ligament apparatus. Methods of knee joint homotransplantation are described. Transplantation of whole joints was also used in the clinic. A woman patient who underwent a knee

Some new furanathrone-derivatives. V. I. MINAKV AND N. A. VOLKOV *Izvest. inst. polytech. Ivanovo-Voznesensk. 15, 107-12 (1980).*—One g. 2,5-CH(OH)C₆H₄CO₂H (I) condenses with 1.25 g. benzoin (II) in 17-25 g. H₂SO₄ (d. 1.84) after 12-8 hrs. to give

is unstable at temps. above 60°. Its soln. in H₂SO₄ (d. 1.84) is intensely red and has a yellow fluorescence when dil., and is yellowish green when concd. The concd. soln. in AcOH is yellowish green and has a green fluorescence. III is insol. in H₂O, NaOH, Na₂CO₃, petr. ether, benzene, EtOH and MeOH, and easily sol. in CHCl₃, CS₂, PhH, Et₂O, AcMe, C₆H₆N, C₆H₅Me, AcOH and EtOH-AcOH mixt. From most of these solns, III is reprecipitated by adding H₂O or petr. ether. This property was utilized in the purification of III, e. g., 1 pptn. from AcOH gave a product giving Carius values for C 4.00-5.61% (theoretical = 10.74%), while 3 successive reprecipitations from AcMe gave a product with Cl 8.82-9.31%. This method of purification involves large losses of material, e. g., from 5-6 g. dried III only 0.15 g. was obtained after 3 reprecipitations from AcMe. III, boiled with PhNH₂ for 1-2 hrs. in the presence of AcONa and (AcO)₂Cu, gives IV (III, R = PhNH) cinnamon-brown powder, sol. in EtOH and AcOH. Reprecipitated IV contains N and probably has the structure shown. III, boiled with β-aminoanthraquinone in C₆H₆ for 10-12 hrs., gives V (III, R = C₆H₄(CO)₂C₆H₄NH), brown powder, insol. in NaOH, and which upon reduction with Na₂S₂O₄ and warming forms a colored soln. which dyes cotton fabric a pale cinnamon color.

Fission of uranium nuclei. N. F. Volkov. *Compt. rend. acad. sci. U. R. S. S.* 24, 529-30 (1939) (in English). — Introductory expts. were carried out in an approach to the problem of the existence of transuraniums, based on Bohr's theoretical concepts explaining the fission of Th and U nuclei (C. A. 32, 3253; 33, 3685). The following expts. were carried out to ascertain whether the process of nuclear fission takes place not only at the very moment of bombardment of U with neutrons, but also somewhat after the bombardment has ceased: (1) 62 g. of Na uranate was bombarded for 24 hrs. by neutrons from the Radium Inst. of the Acad. of Sci. cyclotron, the reaction being $D^2 + D^2 \rightarrow 3H^2 + \alpha^1$. The neutron intensity was approx. that of 20 curies Rn + Be. After bombardment the Na uranate was scattered over an area of 370 sq. cm., and 2 layers of tissue paper were placed at a distance of 7-10 cm. from the surface of the U. Five hrs. later the paper was removed and burned and the ash measured for activity with a Geiger-Müller counter. The recoil atoms were collected 5 times at 5-hr. intervals and each time the ash showed an activity that gradually decreased with a half-life equal to 6.5 hrs. (2) One g. of green U oxide was spread over a surface of 700 sq. cm., surrounded with paraffin and bombarded for 24 hrs. Glass plates were kept 3 mm. from the surface for 4 hrs., then were

removed. Filter paper soaked in 7% HCl was used to wipe the surface facing the U and was dried; it always proved active, showing the same 6.5-hr. half-life period. A control expt., with ordinary U, showed no activity in glass or paper after several days. (3) Fission products of U nuclei bombarded 24 hrs. by neutrons (20 curies Rn + Be) were collected on glass, by the method of radio active recoil (cf. Khlopina, Pasvik-Khlopina and V. C. A. 34, 1350). The glass was removed and covered with 2 layers of paper for 2 hrs. The papers touching the glass and the 2nd layer were burned separately and gave 2 half-lives of 4 and 19 hrs., resp. Further work is reported in progress on the examn. of the tracks of subsequent fission of U nuclei and of its heavier products by the method of differential counters, the Wilson cloud chamber and thick-layered photoplates. Also an attempt at discovering the gaseous decay product and detg. its chem. nature is planned. Frank Gomer

Dissertation: "Heat Exchange by Radiation in the Combustion Chambers of Tubular Furnaces."
Cand Tech Sci, Moscow Order of the Labor Red Banner Petroleum Inst imeni I. M. Gubkin,
22 Jun 54. (Vechernyaya Moskva, Moscow, 11 Jun 54)

SO: SUM 318, 23 Dec 1954

AUTHORS: Volkov, N.F., Geller, Z.I. SOV/90-58-2-4/9

TITLE: On Using Air-Heaters for Tubular Furnaces (K voprosu o primeneniі vozdukhopodogrevateley dlya trubchatykh pechey)

PERIODICAL: Energeticheskiy byulleten', 1958, Nr 2, pp 17-24 (USSR)

ABSTRACT: The author recommends using induced draught in air-heating installations attached to the NPZ tubular furnaces. This measure better exploits the thermal energy of the escaping hot smoke, and slows down the clogging of the pipes. After having mentioned two other methods to increase the efficiency of tubular furnaces (introduction of dolomite or lime into gas pipes; system of regenerative air-heaters), he pays special attention to the system called "pipe-within-a-pipe". This system, developed by Engineer A.A. Akhmed-zade in the Zavod im. Andreyeva ("Andreyev" Plant) at Baku in 1948, essentially consists in leading hot smoke through a pipe, which in its turn is very loosely sheathed by another pipe. The Department of Thermotechnics and Hydraulics of the Groznenskiy neftyanoy institut (Oil Institute of Groznyy) carried out the tests on this system and decided in favor of the system for cases where its installation is technically

Card 1/2

SOV/90-58-2-4/9

On Using Air-Heaters for Tubular Furnaces. For Discussion.

possible and financially expedient. The calculations needed by the system were prepared by the Department, as well as the nomogram for making the calculations easier. The conclusions of the author are: 1) reliable operation of the tubular air-heaters attached to the NPZ furnaces can only be ensured in combination with induced draught; 2) regenerative air-heaters are essentially better than tubular ones. There are 2 tables, 1 nomogram and 9 Soviet references.

TITLE: Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces and the Distribution of Radiant Flux over the Baffles (Nekotoryye osobennosti teploobmena v topkakh trubchatykh pechey i raspredeleniye luchistykh potokov po ekranam)

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1959, Nr 7, pp 38-47 (USSR)

ABSTRACT: After discussing some published work on radiant heat transfer in tubular furnaces the authors describe their own tests on three heating furnaces in the oil industry. These were a two-chamber, double-flow furnace (Fig 1) and type R-1 (Fig 2) and N-1 (Fig 3) single-chamber furnaces. The respective fire-box volumes were 404, 206 and 340 m³. Table 1 gives design details. The authors used VNIIT low-inertia two-sided radiometer-heat probes for measuring local fluxes and also compiled heat balances (Table 2). Thermal fluxes at a constant firing rate were found to be substantially influenced by numerous factors. The relation between radiant flux and total heat output per unit volume of firing box varies for furnaces of different designs. In the furnaces

Card 1/3

SOV/65-59-7-9/12

Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces and the Distribution of Radiant Flux over the Baffles

investigated, the distribution of flux between baffles was very uneven, even taking the average of several determinations: a six-fold ratio between maximum and minimum thermal stresses in baffles was observed in some tests. Aerodynamic factors caused a characteristic distribution of radiant flux (Fig 4) in one of the furnaces (Fig 1). Distribution of thermal flux over a roof baffle is shown in Fig 5. Tests were carried out with burners switched off at various points: greatest uniformity of incident radiant flux was obtained when the burner nearest the baffle was turned off (middle graph of Fig 6, which shows frequency curves for flux intensities). Deposits on the baffles and tubes caused further non-uniformity and led to scatter of experimental points on a graph of roof baffle thermal efficiency as a function of incident radiant flux. The outside deposit surfaces of tubes were found to be 300 - 350 °C hotter than the product being heated, which must greatly restrict the role of convective heat transfer; on the other hand, the authors conclude that the effect of baffling on radiation factors has been

Card 2/3

SOV/65-59-7-9/12

Some Features of Heat Exchange in the Fire-Boxes of Tubular Furnaces
and the Distribution of Radiant Flux over the Baffles

exaggerated (Refs 2, 5). To obtain greatest uniformity in the firing box a cascade control system should be used. For measuring the thermal load on a baffle the authors favour the direct measurement of incident radiation with a radioactive probe (Fig 8). An editorial note invites further contributions on the subject.

Card 3/3 There are 8 figures, 2 tables and 10 Soviet references.
